IR Assignment III

1. Consider a query and a document collection consisting of three documents. Rank the documents using vector space model. Assume tf-idf weighing scheme.

   Query: "gold silver truck"

   Document Collection:

   d1: "Shipment of gold arrived in a truck."
   d2: "Shipment of gold damaged in a fire."
   d3: "Delivery of silver arrived in a silver truck."

	term freq						tf-idf			
term	Q	D1	D2	D3	df	idf = log (N/df)	Q	D1	D2	D3
a	0	1	1	1	3	0	0	0	0	0
arrived	0	1	0	1	2	0.18	0	0.18	0	0.18
damaged	0	0	1	0	1	0.48	0	0	0.48	0
delivery	0	0	0	1	1	0.48	0	0	0	0.48
fire	0	0	1	0	1	0.48	0	0	0.48	0
gold	1	1	1	0	2	0.18	0.18	0.18	0.18	0
in	0	1	1	1	3	0	0	0	0	0
of	0	1	1	1	3	0	0	0	0	0
shipment	1	1	1	0	2	0.18	0.18	0.18	0.18	0
silver	0	0	0	1	1	0.48	0.48	0	0	0.96
truck	1	1	0	1	2	0.18	0.18	0.18	0	0.18

S(Q, D1) = (Q • D1) / (|Q| * |D1|) = 0.33

S(Q, D2) = 0.08

S(Q, D3) = 0.83

Ranking: D3, D1, D2

2. *γ* Codes are relatively inefficient for large numbers as they encode the length of the offset in inefficient unary code. *δ* codes *δ codes* differ from *γ* codes in that they encode the first part of the code (*length*) in *γ* code instead of unary code. The encoding of *offset* is the same. For example, the *δ* code of 7 is 10,0,11 (again, we add commas for readability). 10,0 is the *γ* code for *length* (2 in this case) and the encoding of *offset* (11) is unchanged. (i) Compute the *δ* codes for the numbers 511 and 1025.

4. We have defined unary codes as being "10": sequences of 1s terminated by a 0. Interchanging the roles of 0s and 1s yields an equivalent "01" unary code. When this 01 unary code is used, the construction of a γ code can be stated as follows:
   1. Write G down in binary using $b = \lfloor \log_2 j \rfloor + 1$ bits.
   2. Prepend $(b - 1)$ 0s.

   Encode the numbers 511 and 1025 in this alternative γ code.

```
511:        0000 0000 1, 1111 1111
1025:  0000 0000 001, 00 0000 0001
```

5. Consider the postings list <4, 10, 11, 12, 15, 62, 63, 265, 268, 270, 400> with a corresponding list of gaps <4, 6, 1, 1, 3, 47, 1, 202, 3, 2, 130>. Using variable byte encoding:

   i. What is the largest gap you can encode in 1 byte?

   127 (2^7 - 1) (1 byte)

   ii. What is the largest gap you can encode in 2 bytes?

   In 2 bytes, 2^{14} - 1 = 16383

   iii. How many bytes will the above postings list require under this encoding?

   13

Thanks Jitesh and Suhas for the solutions.
